EDUCATION

- **University of California, San Diego** 2022-2026
B.S. of Computer Science

WORK EXPERIENCE

- **Software Development Engineer Intern** Jun-Sept 2025
Golf District, Remote SQL/Java/Git Actions/Looker Studio/Jira/DBeaver
 - Built a **GitHub Actions CI/CD** automation that cross-references merged PRs with Jira tickets via regex extraction and the GitHub CLI, emailing a consolidated report and reducing manual PR/ticket tracking effort by an estimated 15 hours weekly as part of the team's **Agile** workflow
 - Standardized **90+** table names across the production **relational SQL database**, redesigning the schema to improve long-term maintainability and comprehensibility
 - Debugged and tested an AI-powered booking chatbot against diverse edge cases, troubleshooting and validating correct behavior across multilingual scenarios

PROJECTS

- **CVDioree** Winter 2026
Full Stack Web Application, Go/Java/Python/Perl/JavaScript/HTML/CSS
 - Designed and standardized **24 RESTful API endpoints** as scalable **web services** across four **object-oriented** backend languages (Go, Java, Python, Perl)
 - Built a **JavaScript frontend** to consume REST endpoints, handle session state, and execute asynchronous form submissions, working across both frontend and backend layers
 - Implemented **stateful session management** on the server side to process POST data and maintain reliable client state across different runtime environments
 - Standardized the underlying **relational database schema** to support consistent, reliable data access across all backend services
- **Successorator** Spring 2024
Android App, Java/JUnit/Robolectric/Android Studio
 - Implemented a **state-machine-driven task lifecycle** with support for categorization, prioritization, deadlines, and dynamic filtering, owning the project from design through release
 - Engineered scheduled task fragments backed by **AlarmManager/WorkManager APIs** to deliver automated reminders, decoupling notification logic from UI state for reliability across app lifecycle events
 - Practiced **test-driven development**, achieving **93% test coverage** with an automated JUnit and Robolectric suite covering core business logic and UI fragments
 - Debugged and resolved issues across the app lifecycle, catching regressions before release
- **Life Expectancy Predictor** Winter 2025
Data Pipeline & ML Model, Python/scikit-learn/pandas
 - Built an end-to-end **data pipeline** in **Python** to transform 20+ socioeconomic and health features into an analysis-ready dataset, including min-max normalization and an 80:20 train/test split
 - Engineered **polynomial feature transformations** using scikit-learn's Pipeline and PolynomialFeatures, improving test MSE from 0.0148 to 0.0136 while diagnosing severe overfitting at higher complexity
 - Validated model reliability with **5-fold cross-validation**, achieving a consistent average MSE of 0.0132 and R-squared of 0.72 across folds
 - Documented methodology and results to support reproducibility and future enhancement

LANGUAGES & TECHNOLOGIES

Languages: Java, Python, Go, JavaScript, SQL, C/C++, Perl, HTML/CSS

Tools: Git, GitHub Actions, DBeaver, JUnit, Robolectric, Android Studio, scikit-learn, pandas

Concepts: Full-Stack Development, RESTful API & Web Services, Object-Oriented Programming, Relational Databases & Schema Design, Data Structures & Algorithms, Automated Testing & Debugging, Agile Methodology
